EXPERIMENT 5

ROLL NO: 240701339 NAME: MUKESH V

AIM

The aim of this experiment is to design and model a **Hospital Appointment Management System** using **Lucidchart**.

The objective is to:

- Represent the complete workflow of a patient visiting a hospital.
- Understand user flow from login to exit.
- Identify decision points (such as whether tests are required).
- Demonstrate conditional branching and process merging.
- Improve understanding of system design using flowcharts.

PROCEDURE

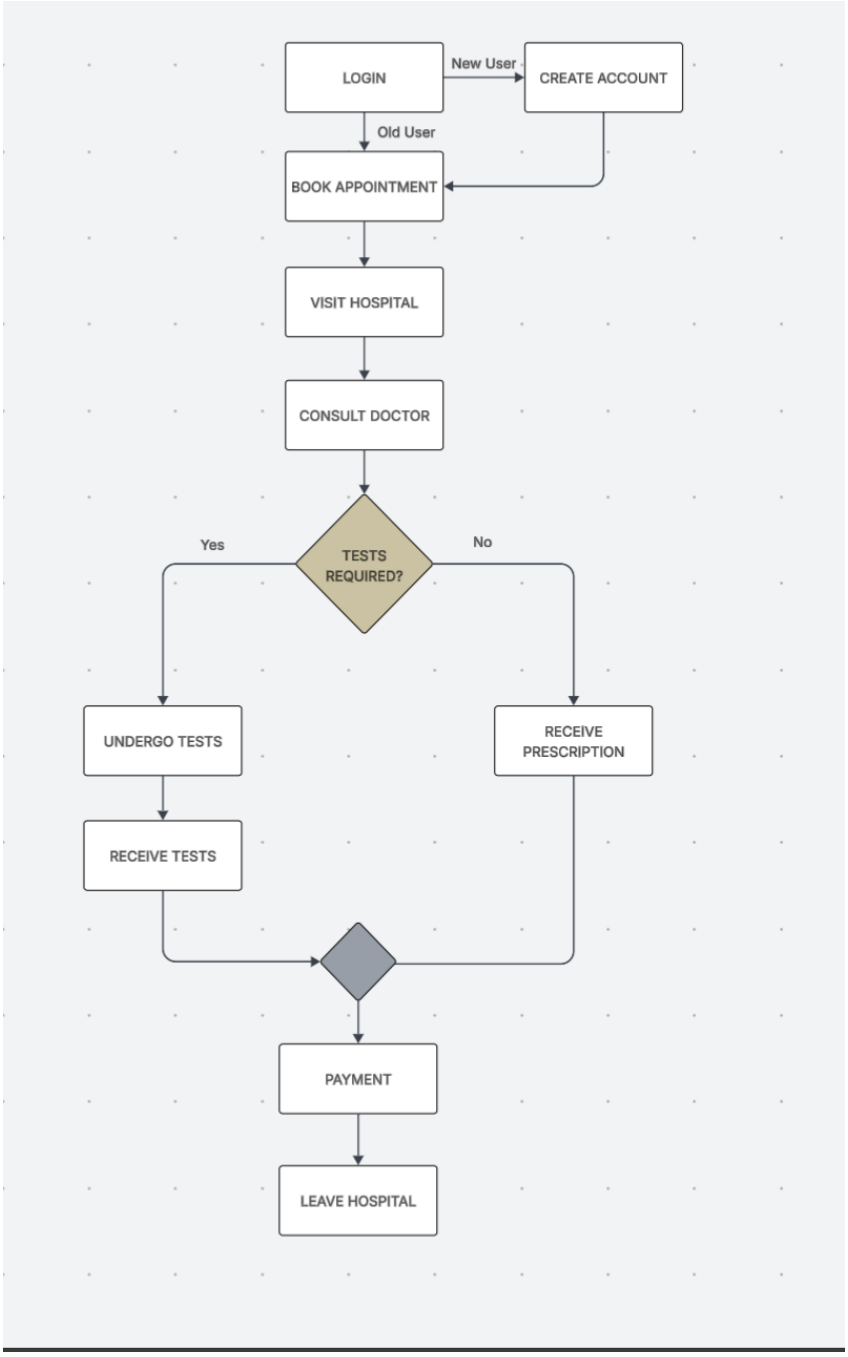
The following steps were followed to create the flowchart in **Lucidchart**:

1. **Opened Lucidchart**
    - Logged into Lucidchart.
    - Created a new blank document.
2. **Selected Flowchart Symbols**
    - Used standard flowchart shapes:
        - Rectangle → Process (Login, Book Appointment, Payment, etc.)
        - Diamond → Decision (Tests Required?)
        - Arrows → Flow direction
3. **Created User Authentication Flow**
    - Added **Login** process.
    - Added decision flow:
        - If New User → Create Account

        - If Old User → Continue to Book Appointment

4. **Designed Appointment Workflow**
    - Added steps:
        - Book Appointment
        - Visit Hospital
        - Consult Doctor
5. **Added Decision-Making Step**
    - Inserted a diamond shape labeled:
        - "Tests Required?"
    - Created two branches:
        - Yes → Undergo Tests → Receive Test Results
        - No → Receive Prescription
6. **Merged Both Branches**
    - Connected both paths to a common point.
    - Continued to Payment process.
7. **Completed the Process**
    - Added final steps:
        - Payment
        - Leave Hospital
8. **Aligned and Organized Diagram**
    - Ensured proper spacing.
    - Used clear arrow directions.
    - Maintained logical top-to-bottom flow.

User Flow Diagram



RESULT

The Hospital Appointment System flowchart was successfully designed using Lucidchart.

The diagram clearly:

- Shows the complete patient journey.
- Includes login and account creation process.

- Represents consultation workflow.
- Incorporates a decision-making condition (Tests Required?).
- Demonstrates branching and merging of processes.
- Ends with payment and exit process.

The flowchart effectively represents the working structure of a hospital management system and improves understanding of system flow, decision logic, and user interaction.
